

In the Claims

1-24 (canceled)

25 (new): An injection molded plastic material container for cosmetic products, comprising a container body with a top product filling and delivery mouth, said top mouth having a top mouth rim encompassing a top mouth opening, said delivery mouth being defined by a single mouth wall, and a top covering element having an outer surface and an inner surface, said container body and covering element being molded as a single piece of a first material, said single mouth wall of said container body and said top covering element being coupled by an integral strip hinge arranged at and integrally molded with said top mouth rim, thereby said covering element is adapted to swing from an open position in which said top mouth is accessible from outside to a closed position in which said top mouth is not accessible and is tightly closed, said covering element being provided with an inner gasket arranged on said inner surface of said covering element and adapted to be engaged in said top mouth at said rim of said top mouth to tightly close said top mouth, wherein said inner gasket is also integrally molded with said covering element and is made of a second material different from said first material.

26 (new): A method for making an injection molded plastic material container for cosmetic products, according to Claim 25, said container comprising a

container body with a top open product filling and delivery mouth, said delivery mouth having a top opening encompassed by a rim portion and being defined by a single mouth wall, and a top covering element having an outer surface and an inner surface, said container body and covering element being molded as a single piece of a first material, said single mouth wall of said container body and said covering element being coupled by an integral strip hinge arranged at and integrally molded with said rim portion, thereby said covering element is adapted to swing from an open position in which said top mouth is accessible from outside to a closed position in which said top mouth is not accessible and is tightly closed, said covering element being provided with an inner gasket arranged on said inner surface of said covering element and adapted to be engaged in said top mouth to tightly close said top mouth, wherein said inner gasket is also integrally molded with said covering element and is made of a second material different from said first material, said method comprising injecting said first material for integrally molding said container body, covering element, strip hinge and further injecting said second material for integrally molding said sealing gasket on said inner surface of said covering element.

27(new): A method according to Claim 26, comprising forming said container with an open bottom and further forming, by blow molding through said top mouth and said open bottom of said container body a cosmetic product vial or tube.
